

ATL-OOI Wire Rope Wear Gauge

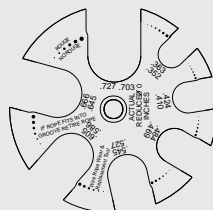

- Anodized aluminum coating to protect against corrosion and wear
- Color coded red for easy imperial tool identification and use
- Re-engineered for a superior wire rope fit. Gauge is now 1 inch thick, and has a new diameter of 2.5 inches, allowing the gauge to be even more portable and easier to use than our previous generation of Wire Rope Gauges. Gauge is capable of measuring seven (7) different rope diameters.
- Imperial gauge (red) allows for full range of measurements: 3/8, 7/16, 1/2, 9/16, 5/8, 11/16 and 3/4 inch
- Precision CNC machined and sized to ASME retirement criteria for wire rope.
- Gauge is also sized to proposed ASME standards for wire rope with rouge.
- Straightforward design and use: As a universal go-no-go gauge, if a specific portion of wire is suspected of wear, or rouging, simply place the gauge slot for that particular original diameter over the rope crowns on a straight section. If the rope will not enter the slot, its diameter is considered satisfactory.
- Add your own custom logo, graphic, text, or color (minimum order required)
